AIRTIES

NEW PRODUCTS, NEW IMAGE, NEW TARGETS

It appears that 4 years were more than enough for AirTies, a company who designs and develops wireless quad play products, such as high speed internet access devices/ADSL, Wireless LANs, VoIP and IPTV equipment, to establish its business model that enables them to move on to the higher level and introduce a new generation product line. This new product line has advanced technological characteristics, easy set-up and function, quality design and a modern, stylish look. Emphasizing the modern look, AirTies had completely renewed even the packages of its wireless products. AirTies also renewed its corporate image. For AirTies, the "next phase" has already begun!

AirTies has announced its new product line in the frame of the international exhibition CeBIT Bilisim Eurasia 2008, attended by the representatives of the magazine Daily Resellers Network. The corporate culture of this company is special, mostly due to the professional experience of its founder Mr. Bulent Celebi, who made a remarkable scientific career in the USA. Today, AirTies' philosophy is based on three axes: technological innovation, driven by the needs of customers, exceptional design supported by the modern look, and the new branding based on the corporate platform developed by the company.

In this framework, the company introduced six new generation products, which, on one hand, would satisfy the growing needs of AirTies customers: end-users and telecom service providers in the countries where it operates, and, on the other hand, will help the company to differentiate itself from the product offerings of its competitors.

Specifically, AirTies launched the wireless USB adaptors Air 2310 and 2410 (wireless data rate 150 Mbps and 300 Mbps respectively), the wireless router Air 4450 (4-ports and wireless access speed 300 Mbps), the ADSL2+ routers Air 5020 and 5050 (2 and 4 ports respectively), as well as the wireless ADSL2+ router 300Mbps Air 5450 (4 ports). From a technological point of view, the above products introduce to the international market the 11n technology, ahead of it becoming a standard! The standardization procedure for 11n is estimated to be complete by spring 2009. In terms of a connection speed, the previous 11g standard allowed speed to reach 54Mbps, whereas with the 11n speed reaches 300 Mbps.

In regards with the coverage area, it can be expanded inside and outside of an office or a home. One of the winning features of 11n is the fact that it will be compatible with older equipment of 11g and 11b standards, and it will also function in the frequency of 5 GHz. It should be noted that AirTies has developed a unique an innovative technology, called AutoMesh, which gives the ability to wireless internet access devices to extend the coverage area within the spaces with concrete walls or any similar obstacles for the signal's strength! The company plans to upgrade the AutoMesh software within 2H2009, making possible even for an older generation equipment to benefit from this technology.

At the same time, the company has further enhanced some key product features related to their easy set-up and flawless function, such as capability to identify, connect and create a wireless network with just one touch of a button, low energy consumption, high level of security, interface in the local language, etc. The new products are covered by a 3-year warranty - same with all other AirTies products - and are expected to be available on the Greek market in November 2008.
