WHAT'S NEW?

Air 7224

WHAT DOES IT DO?

AirTies will be previewing what it describes as the industry's first high definition 802.11n wireless video set-top box featuring self-service customer provisioning, 3D graphics, and solid state storage on NAND flash. Air 7224, the high-definition, wireless, IPTV/WebTV set-top box, will be on display on its stand as well as in partner booths of SeaChange, GooMe, Orca, Nordija and Opera. The Air 7224 will be the first STB to offer wireless video distribution at home in conjunction with a compatible AirTies wireless gateway. With the addition of AirTies' Mesh Networking, the need to run cables between multiple devices at home is totally eliminated. The combination of AirTies STB and gateway enables a one-touch installation and setup of a secure wireless network by the end-user, according to the company. The AirTies box features the new Broadcom BCM7413 chipset, offering high-definition 3D graphics and up to 96GB NAND flash memory, as well as wireless video and self-service installation. The hardware accelerator for 3D OpenGL ES allows for more sophisticated user-interface possibilities while the default 2GB solid state NAND flash offers a cost-effective pause-liveTV feature without the shortcomings of a mechanical hard-drive, according to AirTies.
